## Abstracts

Terahertz imaging devices are advanced non-invasive inspection tools that operate within the terahertz frequency range (0.1-10 THz), utilizing electromagnetic waves to penetrate a wide array of non-conductive materials such as plastics, textiles, ceramics, paper, and biological tissues while producing high-resolution images without the ionizing radiation risks associated with X-rays. These systems function by emitting terahertz radiation and detecting either reflected or transmitted signals to construct two- or three-dimensional representations of internal structures, defects, or compositional variations, making them invaluable for applications requiring detailed subsurface analysis, quality control, security screening, and scientific research.

The global Terahertz Imaging Devices market size was estimated at USD 185.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 18.50% during the forecast period.
