Abstracts

Terazosin hydrochloride is a selective alpha-1 adrenergic receptor blocker primarily prescribed for the treatment of symptomatic benign prostatic hyperplasia (BPH) to improve urinary flow and reduce associated symptoms, as well as for the management of hypertension either as monotherapy or in combination with other antihypertensive agents; it functions by relaxing smooth muscle in the prostate and bladder neck as well as dilating blood vessels, thereby lowering blood pressure and alleviating urinary obstruction. The market for terazosin hydrochloride is characterized by its position within the broader alpha-blocker drug class, facing competition from both other alpha-blockers like tamsulosin and alternative BPH treatments such as 5-alpha reductase inhibitors, as well as newer minimally invasive surgical options; while it remains a cost-effective option, especially in generic form, its use has been partly supplanted by drugs with more favorable side effect profiles, particularly those with greater uroselectivity that minimize cardiovascular effects. Geographically, demand is sustained across both developed and emerging markets, though growth is tempered by patent expirations, the availability of numerous alternatives, and evolving clinical guidelines that increasingly favor combination therapies or newer agents for certain patient subgroups; nevertheless, it maintains a niche role in specific therapeutic scenarios, particularly where cost constraints are a significant factor or in cases where dual benefits for hypertension and BPH are desired.

The global Terazosin Hydrochloride market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
