Abstracts

Terbinafine Hydrochloride is a synthetic allylamine antifungal agent used primarily in the treatment of dermatophyte infections such as onychomycosis (fungal nail infections) and tinea corporis, cruris, and pedis (ringworm, jock itch, and athlete's foot). It functions by inhibiting the enzyme squalene epoxidase, disrupting ergosterol synthesis—an essential component of fungal cell membranes—leading to fungal cell death. Available in both oral and topical formulations, it is valued for its fungicidal (rather than fungistatic) activity, broad-spectrum efficacy, and generally favorable safety profile, though liver enzyme monitoring is recommended during oral treatment due to potential hepatotoxicity risks.

The global Terbinafine Hydrochloride market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
