Abstracts

Testosterone replacement therapy (TRT) is a medical intervention designed to address low testosterone levels in individuals, particularly men. Testosterone, a key male sex hormone, plays a crucial role in various bodily functions, including the development of secondary sexual characteristics, maintaining bone density, muscle mass, and energy levels. When testosterone levels decline due to aging, medical conditions, or other factors, individuals experience symptoms such as fatigue, reduced libido, mood swings, and diminished cognitive function. Testosterone replacement therapy aims to restore testosterone levels to normal ranges, alleviating these symptoms and potentially improving overall well-being. Injection is the common methods of administering testosterone replacement therapy. According to 2023 report by National Library of Medicine it was reported that hypogonadism occurs in 19% of men in their 60s, 28% of men in their 70s, and 49% of men in their 80s. In addition, according to the World Health Organization, it was reported that by 2030, 1 in 6 people in the world are expected to be aged 60 years or over.
