Abstracts

Tetracycline hydrochloride is a broad-spectrum antibiotic derived from *Streptomyces* bacteria, belonging to the tetracycline class of medications; it functions by inhibiting bacterial protein synthesis, effectively treating a wide range of bacterial infections?including respiratory tract infections, acne, urinary tract infections, and certain sexually transmitted diseases?by binding to the 30S ribosomal subunit, thereby preventing aminoacyl-tRNA from attaching to the mRNA-ribosome complex. While its usage has declined in human medicine due to the development of bacterial resistance and the availability of newer antibiotics, it retains significant applications in veterinary medicine, livestock production, and aquaculture for disease prevention and growth promotion, though regulatory restrictions on antibiotic use in animal feed are increasingly impacting demand in these sectors. The market is characterized by a competitive landscape with numerous generic manufacturers, price sensitivity, and evolving regulatory frameworks aimed at combating antimicrobial resistance, while growth is driven by demand in emerging economies and niche therapeutic areas where tetracyclines remain effective.

The global Tetracycline Hydrochloride market size was estimated at USD 250.6 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.75% during the forecast period.
