### Report Overview

The carbon tetrafluoride is a colorless, odorless, slightly ethereal gas at normal temperature and pressure. It does not burn in the air and is a relatively stable non-toxic substance. However, at high temperatures, or when combusted with a combustible gas, toxic fluorides are decomposed. It can form carbonyl fluoride with carbon dioxide above 1000 °C. Slightly soluble in water, the solubility in water is 0.0015% by weight at 25 ° C, 101.325 kPa. It has a slight hydrolysis. Carbon tetrafluoride is the most widely used plasma etching gas in the microelectronics industry. It can be widely used in the etching of thin film materials such as silicon, silicon dioxide, silicon nitride, phosphosilicate glass and tungsten. The production, laser technology, gas phase insulation, low temperature refrigeration, leak test agent, control of the attitude of the space rocket, detergents in the production of printed circuits are also widely used. Due to its chemical stability, carbon tetrafluoride can be used for metal smelting, such as: copper, stainless steel, carbon steel, aluminum, Monel, etc.; also used in the plastics industry; such as: synthetic rubber, neoprene, polyurethane ester.
