Report Overview

Pyrrolidine, also known as tetrahydropyrrole, is a five-membered nitrogen-containing saturated heterocyclic compound. Pyrrolidine is a colorless, transparent liquid with a special ammonia smell. It is easy to turn yellow and toxic when exposed to light or humid air. Derivatives of tetrahydropyrrole are widely present in many natural products, such as nicotine in tobacco and proline in protein, which is a 2-substituted tetrahydropyrrole. It is obtained by catalytic hydrogenation of pyrrole. Hydrogenation of pyrrole is much more difficult than furan, but it is not easy to hydrogenate under mild conditions, and tetrahydropyrrole can be obtained by catalytic hydrogenation of platinum in higher reactions. After hydrogenation, the aromaticity of the pyrrole ring is lost, so that the basicity of the products dihydropyrrole (pyrroline) and tetrahydropyrrole is enhanced. It is used as a pharmaceutical raw material, special organic solvent, also used in organic synthesis. Tetrahydropyrrole acts as a secondary amine and can form enamines with ketones, which is useful in organic synthesis.
