Abstracts

Tetramethylsilane (TMS or 4Ms) is an organosilicon compound with the chemical formula $\text{Si}(\text{CH}_3)_4$, primarily recognized as the universal internal reference standard in nuclear magnetic resonance (NMR) spectroscopy due to its sharp singlet peak, chemical inertness, volatility, and solubility in most organic solvents. It serves as a crucial calibration marker, providing a zero-ppm reference point for chemical shift measurements across both proton (^1H) and carbon-13 (^{13}C) NMR analyses, ensuring accuracy and reproducibility in spectral data interpretation for research, pharmaceutical development, and chemical manufacturing. Beyond its role in spectroscopy, TMS is utilized as a precursor in organic synthesis and silicon-based material production, though these applications remain secondary to its dominance in analytical chemistry.

The global Tetramethylsilane (4Ms) market size was estimated at USD 78.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.25% during the forecast period.
