Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Textile Electrode competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global production of fabric electrodes was estimated at 150-250 million units, with an average selling price of approximately US\$15-35 per unit and a gross profit margin of about 40%. Single-line production capacity was estimated at 800,000-1.2 million units. Fabric electrodes are flexible, wearable electronic devices made by combining conductive materials with traditional textiles. Their core function is to act as sensors or actuators, non-invasively collecting bioelectrical signals (such as electrocardiograms, electroencephalograms, and electromyograms) or applying electrical stimulation to the human skin surface. The upstream supply chain of fabric electrodes mainly includes suppliers of specialty materials such as silver fibers and conductive polymers, as well as providers of textile substrates and nano-coating technologies. The midstream encompasses core manufacturing stages such as conductive fiber spinning, smart fabric weaving, electrode cutting, and packaging testing. Downstream applications are mainly in medical monitoring equipment (such as smart ECG clothing), consumer electronics (sports bracelets), and military operational monitoring. The demand fundamentally stems from the rigid demand for long-term physiological monitoring driven by the development of telemedicine, the consumption upgrade of wearable devices brought about by increased public health awareness, and the professional field's pursuit of non-invasive and dynamic human data collection technologies. These factors collectively constitute the core driving force behind the development of this industry.

The global Textile Electrode market size was estimated at USD 3000.0 million in 2025

and is projected to grow at a compound annual growth rate (CAGR) of 10.00% during the forecast period.
