## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on TFLN Chip competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global TFLN Chip capacity 450 k Pcs, sales reached approximately 413 k Pcs, with an average market price of around 230USD/Pcs, gross margin 45%. Thin-film lithium niobate (TFLN) photonic chips leverage LiNbO<sub>3</sub>'s large Pockels effect ( $r_{33} \approx 31$  pm/V) to achieve highly efficient electro-optic modulation with RF-optical velocity matching; commercial devices now exceed 110 GHz bandwidth at low V<sub>π</sub> and insertion loss. Thanks to ultralow-loss waveguides, propagation loss has reached the few-dB-per-meter regime, and the platform spans from visible/NIR to telecom O/C/L bands, combining speed, low loss, and broad spectral coverage. Key applications include high-speed data-center/coherent modulators, frequency combs and nonlinear conversion, acousto-optic components, quantum photonics, and microwave-to-optical transduction. The TFLN Chip value chain runs from crystal growth and boule slicing, through thin-film creation and wafer bonding to form LNOI/TFLN wafers (ion-cut or direct bonding with SiO<sub>2</sub>/Si, plus electrode and dielectric stacks), into mid-stream design-manufacturing platforms (EDA/PDK, MPW shuttles, ICP-RIE etch, anneal/poling, electrode deposition and CMP), then heterogeneous integration and packaging (flip-chip or grating coupling to InP/DFB lasers and Ge/Si photodiodes, high-speed RF packaging, fiber arrays and thermal management), with characterization (V<sub>π</sub>L, insertion loss and S<sub>21</sub> bandwidth, linearity and reliability), and finally downstream applications in coherent datacom transmitters and 800G/1.6T modules, microwave photonics and spectrum processing, FMCW LiDAR, low-noise microcombs and optical synthesis, and quantum photonics and precision sensing; the dominant trends are larger-wafer scaling and yield ramp, standardized PDKs and open

ecosystems, tighter co-design with CMOS/advanced packaging, and system-level integration such as CPO and HLTO.

The global TFLN Chip market size was estimated at USD 95.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 18.00% during the forecast period.
