Report Overview

Photomask consists of a fused silica (QZ) or, glass (SL) substrate coated with an opaque film, in to which an accurate replication of the device designer's pattern is etched. Photomask has a similar function as a film used in photography. Just like the identical pictures are printed from the film, photomask can reproduce thousands of circuits and patterns. The photolithography technique is employed in the photomask manufacturing process to create chrome pattern on a quartz substrate.

Fine Metal Mask (FMM) is a metal material board that is thinner than paper, and is a consumable core component for the production of organic light-emitting diode (OLED) displays. FMM has many microscopic holes that are invisible to the naked eye. Its main role is to deposit RGB organic substances and form pixels during the AMOLED production process to ensure the resolution and yield of the panel. It is a core and challenging technology in the production of UHD displays, and it is expected to have high growth potential as a new market in the future.
