## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on TGV Electroplating System competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The TGV electroplating system is an advanced manufacturing process that deposits conductive metal, typically copper, into micro-vias drilled in glass substrates to enable vertical electrical interconnections in 3D integrated circuits. Its primary purpose is to facilitate high-density, low-loss electrical connectivity between stacked chip layers, enhancing system integration and performance in compact electronic devices. The system offers benefits such as improved signal integrity, reduced transmission loss, and compatibility with high-frequency applications, making it ideal for sensors, MEMS, and telecommunications. Functionally, TGV electroplating ensures reliable, high-aspect-ratio metallization, supports heterogeneous integration, and mitigates thermal mismatch issues through optimized process control. In 2024, global TGV Electroplating System production reached approximately 88 units, with an average global market price of around US\$ 2,256 K USD per unit. The TGV (Through-Glass Via) Electroplating System market is rapidly expanding, driven by the increasing adoption of advanced packaging technologies in semiconductors, particularly in 3D integrated circuits, MEMS, and micro-LED displays. These systems enable precise plating of copper or other conductive metals through glass substrates, facilitating high-density interconnections and enhanced device performance. Growth in consumer electronics, automotive electronics, and high-performance computing sectors fuels demand, while innovations in equipment automation, process control, and yield optimization further support market expansion. However, the market faces challenges such as high capital costs, complex process integration, and stringent quality requirements, which limit adoption among smaller manufacturers. Overall, downstream demand is trending toward miniaturization, higher

reliability, and cost-effective mass production, positioning TGV electroplating systems as critical enablers in next-generation semiconductor manufacturing.

The global TGV Electroplating System market size was estimated at USD 199.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.20% during the forecast period.
