Abstracts

Thallium, NaI(Tl) is added to sodium iodide crystals. When exposed to ionizing radiation, it will emit photons (scintillation), so it is used in scintillation detectors, traditional nuclear medicine, geophysics, nuclear physics, and environmental measurements. . NaI(Tl) is the most widely used scintillation material and has the highest light output. Sodium iodide crystals are usually attached to a photomultiplier tube and sealed in a sealed unit because of the deliquescent nature of sodium iodide. Crystal growth under different conditions can be obtained by fine-tuning some parameters (such as radiation hardness, afterglow, and transparency). When the ratio of additives in the crystal is high, it can be used in X-ray detectors with high spectral quality. Sodium iodide is available as both single and polycrystalline in this application.
