Abstracts

A thermal coagulation unit is a specialized medical device used in surgical and interventional procedures to achieve hemostasis (control bleeding) or to ablate tissue by applying precisely controlled thermal energy, typically through radiofrequency or other energy-based modalities. These devices utilize localized heat to denature proteins and coagulate blood vessels or tissue surfaces, offering a minimally invasive alternative to traditional surgical techniques. They are widely employed across various medical disciplines, including general surgery, gynecology, neurosurgery, dermatology, and gastroenterology, for applications ranging from sealing blood vessels during operations to treating lesions or abnormal tissue growth. Key features often include adjustable temperature settings, real-time monitoring, and compatibility with different probe designs to suit specific clinical needs, balancing efficacy with safety to minimize collateral damage to surrounding healthy tissues.

The global Thermal Coagulation Unit market size was estimated at USD 255.68 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
