Abstracts

Thermal conductive graphite film is a material with high thermal conductivity formed by repeated heat treatment of polymer film under sintering conditions. In the process of thermal decomposition, the molecular structure of the polymer film recombines to form a highly oriented graphite film. The higher the degree of graphitization, the more perfect the lattice, and the better the thermal conductivity. Its important characteristics include light weight, low thermal resistance, high thermal conductivity, etc. In addition, the difference between thermal conductive graphite film and many other thermal conductive and heat dissipation materials is that it can conduct uniform heat conduction in two directions. When applied to electronic products, it can improve the performance of electronic products while shielding heat sources and components. This report focuses on thermal conductive graphite film for consumer electronics.

The global Thermal Conductive Graphite Film For Consumer Electronics market size was estimated at USD 750.25 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
