### Report Overview

A thermal conductivity gas analyzer is an instrument used to measure the composition of a gas. It is based on the principle of heat conduction and determines the composition of a gas by measuring its effect on heat transfer. Thermal conductivity gas analyzers typically include a sensor and a control system. The sensor has a heating element and a temperature measuring element, usually in the form of a thermistor or thermocouple. As gas flows through the sensor, the heating element will heat the area and the temperature measuring element will measure the temperature of the heated area. Different gases have different effects on the conduction of heat, so from the measured temperature change, the composition of the gas can be inferred.
