The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Thermal Desorption Mass Spectrometer competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global production of thermal desorption mass spectrometers will be 1,930 units, with an average price of US\$41,800 per unit. A Thermal Desorption Mass Spectrometer (TD-MS) is an analytical instrument that combines thermal desorption with mass spectrometry. It is used to study the composition and properties of materials by heating them and analyzing the desorbed gases. The process involves heating a sample, which causes molecules adsorbed or contained within the material to be released (desorbed). These desorbed molecules are then analyzed by a mass spectrometer, which separates them based on their mass-to-charge ratio, providing information about the types and amounts of volatile compounds present in the sample. The thermal desorption mass spectrometry (TD-MS) industry chain mainly consists of upstream high-precision core component suppliers and downstream application industries. Upstream sectors include ion sources, electro-vacuum components, mass spectrometry detectors, precision machining, and the supply of high-purity inert gases. Representative upstream companies include Pfeiffer Vacuum and Edwards Vacuum, which provide detectors and vacuum components; MKS Instruments and Kurt J. Lesker, which provide ion source materials and processed parts; and Air Liquide and Linde, which provide high-purity helium, argon, and other carrier gases. These upstream companies are responsible for supplying core materials and high-precision components, and their technological level directly affects the equipment's performance in terms of sensitivity, stability, and background noise control. The industry is developing towards high-end, fully automated, and precise technologies. With increasingly stringent environmental regulations, higher VOC

emission standards, and continuous upgrades to the testing standards for extractable and leachable substances (E&L) in pharmaceutical packaging, TD-MS, as a rapid detection tool for small sample volumes, is experiencing increasing penetration. The requirements for surface adsorption molecule detection in advanced semiconductor processes are also driving the development of equipment towards higher resolution and lower detection limits. Meanwhile, automation of sample processing modules, intelligent data recognition algorithms in software platforms, and integrated online monitoring are becoming key directions for product iteration. Driving factors primarily stem from stringent environmental regulations, the demand for high-end materials development, increasing cleanliness requirements in chip manufacturing processes, and the real-time needs of security monitoring. Obstacles include high equipment prices, the need for professional operator training, high costs and a concentrated supply chain for core mass spectrometry components, and continued competition from alternative analytical methods in some industries (such as GC-MS and PTR-MS). The annual production of thermal desorption mass spectrometers is approximately 120–250 units per year. The gross profit margin for branded manufacturers is generally 38%–55%, while high-end semiconductor detection models can reach 55%–60%.

The global Thermal Desorption Mass Spectrometer market size was estimated at USD 83.7 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.30% during the forecast period.
