Abstracts

In a heating system, especially a closed system, the volume of water expands and contracts as the temperature changes. Thermal Expansion Tank is a functional product that can automatically stabilize the pressure. Its function is to absorb the volume of the expansion tank when the temperature of the working medium increases, and to prevent the system pressure from rising too fast, and to release the airbag when the temperature of the working medium decreases and the volume shrinks. The liquid is added to the system to prevent the system pressure from falling too sharply and reduce the number of times of water replenishment.

The global Thermal Expansion Tank for Heating market size was estimated at USD 1080.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
