Abstracts

Thermal Hydrocarbon Resin is a type of resin that is produced through a thermal polymerization process of hydrocarbon - based monomers. These monomers are typically derived from petroleum - based feedstocks. During the thermal polymerization, the monomers are heated to a specific temperature range in the presence of a catalyst or initiator, causing them to undergo polymerization and form a high - molecular - weight resin. Thermal hydrocarbon resins have a variety of properties, including good adhesion, solubility in organic solvents, and excellent thermal stability. They are widely used in the coatings, adhesives, and ink industries, among others, to improve the performance and quality of the final products, such as enhancing the tackiness, durability, and color stability of adhesives and inks, and providing better film - forming properties and gloss in coatings.

The global Thermal Hydrocarbon Resin market size was estimated at USD 702.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
