## Abstracts

Thermal imaging cooled movement is the core component of thermal imaging technology. It is based on the principle of infrared radiation and uses a cooled detector. The temperature of the detector is reduced through cooling technology, thereby reducing thermal noise interference and improving the detection sensitivity of infrared radiation. By detecting the infrared radiation emitted by the object, it is converted into an electrical signal, and then processed to form a visible thermal image. It has the characteristics of high resolution, high sensitivity, low noise, and wide spectrum response. It is widely used in security monitoring, military reconnaissance, industrial detection, scientific research and development, etc.

The global Thermal Imaging Cooled Movement market size was estimated at USD 2840.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.70% during the forecast period.
