Report Overview

Thermal insulation is a process to prevent the heat flow between objects. The thermal insulation coating is commonly available in solid, liquid, or semi-liquid forms, which helps prevent the heat flow between different objects. The coating significantly helps reduce the heat loss. Thermal insulation coating has high thermal co-efficiency and low conductivity, which help prevent the objects from ultraviolet (UV) and infrared lights. These coatings also provide personnel protection. R-value is used to measure the resistance to heat flow. Therefore, the higher the R-value, the higher the heat resistance. Thermal insulation is one of the most cost-effective ways to reduce the carbon footprint as less energy is required to limit the transmission of heat to the environment. Therefore, thermal insulated residential and non-residential buildings are less affected by changes in temperature.
