Abstracts

Thermal screening devices are non-contact medical instruments that measure body temperature from a distance using infrared technology, primarily detecting heat radiation emitted from the human body, often focusing on the forehead or inner canthus of the eye, to identify individuals with elevated temperatures which may indicate fever? a common symptom of infectious diseases. These devices, which include handheld infrared thermometers, fixed thermal cameras, and automated walkthrough systems, gained prominence during public health crises such as the COVID-19 pandemic for enabling rapid, large-scale preliminary fever screening in high-traffic areas like airports, hospitals, schools, and corporate facilities while minimizing physical contact and reducing transmission risks.

The global Thermal Screening Devices market size was estimated at USD 1050.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
