Report Overview

Thermal warpage inspection system refers to a type of inspection system that is used to detect and measure thermal deformation or warpage in electronic packages, circuit boards, and other similar devices.

During the manufacturing process, temperature changes can cause deformations that can affect the overall quality and performance of the product. Thermal warpage inspection systems help manufacturers to identify these deformations and make necessary adjustments to ensure that the final product meets the required specifications.

The thermal warpage inspection system uses a combination of optical and image processing technologies to detect and measure the degree of warpage or deformation in a material or object. The system captures images of the object before and after heating and then compares the two images to determine the amount of warpage.

Thermal warpage inspection systems are commonly used in the electronics industry to ensure the reliability and functionality of electronic devices, but they can also be used in other manufacturing processes where temperature changes can cause deformation or warpage.
