The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Thermally Conductive Polymer Films competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global production of Thermally Conductive Polymer Films reached approximately 8 million square meters, with an average global market price of around USD 157 per square meter. Thermally Conductive Polymer Films are advanced polymer-based materials engineered to efficiently transfer heat while maintaining electrical insulation, flexibility, and lightweight properties, making them ideal for thermal management in electronics and electrical devices. These films are typically composed of polymer matrices such as polyimides, polyesters, or polyethylene-based resins infused with thermally conductive fillers like ceramic particles (e.g., alumina, boron nitride, or aluminum nitride), graphite, or carbon-based nanomaterials to enhance their heat dissipation capability. They are used to spread or dissipate heat away from sensitive components, helping prevent overheating, improve device reliability, and extend operational lifespan in applications such as flexible printed circuits, batteries, LEDs, and power modules.

The global Thermally Conductive Polymer Films market size was estimated at USD 1254.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.40% during the forecast period.
