Abstracts

A thermo generation module is a solid-state device that converts heat energy directly into electrical power through the thermoelectric effect, utilizing the Seebeck effect where a temperature difference across dissimilar semiconductors generates a voltage. These modules consist of multiple thermocouples connected electrically in series and thermally in parallel, enabling efficient energy harvesting from waste heat sources in industrial processes, automotive exhaust systems, or even body heat in wearable electronics. They are valued for their reliability, lack of moving parts, silent operation, and ability to function in harsh environments, making them suitable for applications ranging from remote power generation and aerospace to consumer electronics and green energy solutions.

The global Thermo Generation Module market size was estimated at USD 2200.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
