Report Overview

Thermo-mechanically treated (TMT) steel bars are manufactured using the metallurgical process which combines mechanical deformation such as compression, forging, and rolling with thermal processes such as heat treatment and quenching. In the thermal mechanical treatment process, a freshly rolled steel rod, which is at a high temperature, is rapidly cooled and its periphery, creating a hard material layer called martensite. The rod shrinks or compresses when it is cooled. This arranges the crystalline structure uniformly. This compression strengthens the rod. The core of the rod remains hot after the heat treatment, thus forming a ferrite-pearlite inner layer. The Thermo-mechanically Treated (TMT) process strengthens the steel rod and make it ductile.
