Report Overview

A thermocouple flow sensor is a sensor used to measure fluid flow. It uses the principle of heat conduction to determine the flow rate of the fluid. Depending on the design and working principle of the flow sensor, a thermocouple flow sensor can measure the flow rate of gas or liquid. By measuring the temperature difference between the heating element and the measuring element, the flow rate of the fluid can be determined. This type of sensor is typically used in applications that require high accuracy and fast response, such as gas flow measurement, air flow measurement, and some chemical and environmental monitoring applications.
