Report Overview

Thermocouple The basic unit of a power sensor is a thermocouple. A single thermocouple unit consists of two metals connected in series, a thermocouple is a sensor used to measure temperature. Thermocouple power sensors work by absorbing incident laser radiation and converting it to heat, which then flows to a heat sink. The temperature difference between the absorber and heat sink is converted into an electrical signal through the thermocouple junction. Unlike semiconductor sensors, thermocouple power sensors do not saturate and have high power capability and flat spectral response. Thermocouples are a very popular sensor due to their relatively low cost, interchangeability, wide measurement range, and reliability. Thermocouple power sensors are an ideal solution for measuring the average power of continuous wave lasers or pulsed laser energy.
