Abstracts

Thermoelectric devices are solid-state energy converters that utilize the thermoelectric effect to directly convert temperature differences into electrical voltage, or conversely, use electrical energy to create a temperature differential, enabling both power generation (when a temperature gradient is applied) and active heating or cooling (when an electric current is supplied) without moving parts, refrigerants, or combustion. These devices consist of pairs of p-type and n-type semiconductor materials connected electrically in series and thermally in parallel, offering advantages such as high reliability, silent operation, compact size, and precise temperature control, though their efficiency remains lower than conventional systems, limiting their use to niche applications where these unique benefits outweigh performance trade-offs.

The global Thermoelectric Devices market size was estimated at USD 720.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
