Report Overview:

The Thermoelectric Cooler module (TEM), also known as the Thermoelectric Cooler or Thermoelectric Cooler, is a semiconductor device composed of many small and effective heat pumps. By loading a low DC voltage at both ends of the Thermoelectric Cooler, the heat will flow from one end of the component to the other.

At this point, one end of the cooler will be cooler and the other end will be warmer.

By changing the direction of the current, you can change the direction of the heat flow, sending heat to the other end.

Thermoelectric coolers, also known as solid state heat pumps, can perform both cooling and heating functions on a single thermoelectric refrigerator.

By changing the direction of the current, the cooling plate can have the function of cooling and heating.

By changing the current, the cooling temperature is different, and thermoelectric coolers can be used for precise temperature control.

The Global Thermoelectric Modules System Market Size was estimated at USD 745.87 million in 2023 and is projected to reach USD 927.54 million by 2029, exhibiting a CAGR of 3.70% during the forecast period.
