Report Overview

Thermopile gas sensor detectors are a type of gas sensor that works based on the Seebeck effect. The Seebeck effect occurs when two different metals are connected in a circuit, and a temperature difference is applied across them, causing a voltage difference to appear between the metals. When a gas molecule absorbs infrared radiation, it causes a change in the temperature of the sensing element, which then generates a voltage difference that can be measured and correlated to the concentration of the gas.
