Report Overview

A thermopile infrared detector is a type of thermal detector that uses the Seebeck effect to generate an electric signal proportional to the incident infrared light energy. The thermopile consists of a series of small thermocouples on a silicon chip that absorb the infrared radiation and produce a temperature difference between the hot and cold junctions. The thermopile detector can measure the temperature of an object from a distance by detecting its infrared emission, without requiring physical contact. Thermopile detectors are widely used in applications such as gas measurement, fire detection, non-contact thermometers, and medical devices.

The global Thermopile Infrared Detector market size was estimated at USD 549.80 million in 2023 and is projected to reach USD 723.66 million by 2032, exhibiting a CAGR of 3.10% during the forecast period.

North America Thermopile Infrared Detector market size was estimated at USD 150.98 million in 2023, at a CAGR of 2.66% during the forecast period of 2024 through 2032.
