Report Overview

Thermoset plastics, or thermoset composites, are synthetic materials that strengthen when heated, but cannot successfully be remolded or reheated after initial heat-forming or molding. After thermosets are molded, the resulting parts offer protection against high operating temperatures, corrosion, and chemical resistance. These material property benefits allow molded thermoset parts to be used in a variety of aggressive and challenging end-use environments, from electrical applications to automotive powertrain and transmission components to products with outdoor element exposure. Using a thermoset molding process allows final parts and assemblies to remain dimensionally and chemically stable against elements such as moisture, high heat or operating temperatures, electric voltage, and chemicals or automotive fluids.

The global Thermoset Compounds For Vehicles Powertrain market size was estimated at USD 3850.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
