Abstracts

Thermosetting composites are a class of advanced materials consisting of a polymer matrix—typically epoxy, polyester, vinyl ester, or phenolic resins—that irreversibly cure and harden when heated, combined with reinforcing fibers such as glass, carbon, or aramid to enhance mechanical properties like strength, stiffness, and thermal resistance; these materials are distinguished from thermoplastics by their inability to be remolded after curing, making them ideal for high-performance applications where dimensional stability, chemical resistance, and durability under extreme conditions are required.

The global Thermosetting Composites market size was estimated at USD 16250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global Thermosetting Composites market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
