Abstracts

A thermosonic wire bonder is a semiconductor assembly tool that utilizes a combination of heat, ultrasonic energy, and mechanical force to create electrical interconnections between a microchip and its packaging. This process involves feeding a fine gold or copper wire through a capillary, where the application of heat softens the bonding surface while ultrasonic vibrations scrub the interface to remove contaminants and facilitate atomic diffusion, resulting in a strong, reliable metallic bond without the need for additional materials like solder or flux. It is predominantly used for creating wedge or ball bonds in high-reliability applications, such as in aerospace, medical devices, and advanced computing, where precision, mechanical strength, and electrical performance are critical.

The global Thermosonic Wire Bonder market size was estimated at USD 420.65 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
