The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Thermostatic Bimetal Coils competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Thermostatic Bimetal Coils are functional composite materials made by laminating two or more metals with different coefficients of thermal expansion through rolling, diffusion bonding, or explosive welding processes. They are typically supplied as coils or cut-to-length sheets and are primarily used to manufacture temperature control elements, switches, and sensors. The upstream raw materials include nickel-based, copper-based, and manganese-based functional alloys, as well as low-alloy steel and stainless steel backing materials. The production process involves critical steps such as heat treatment, annealing, and surface finishing. Downstream customers span multiple industries, including household appliances, power control, automotive electronics, industrial automation, HVAC and building systems, aerospace, and renewable energy equipment. In 2024, global production capacity of thermostatic bimetal coils and sheets is approximately 15,000 tons, with shipments totaling around 11,263 tons. The average selling price is about \$42/kg, and the industry maintains an average gross margin of approximately 23%, reflecting the balance between material costs and specialized processing requirements.
