Abstracts

Thermosyphon reboilers are specialized heat exchange devices used primarily in the chemical, petrochemical, and refining industries to vaporize a portion of the bottom product from a distillation column by utilizing natural convection driven by density differences, where the heated process fluid rises into the column while the denser, cooler liquid descends into the reboiler, eliminating the need for mechanical pumps and offering energy-efficient operation with relatively low maintenance requirements compared to forced-circulation systems.

The global Thermosyphon Reboilers market size was estimated at USD 180.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.25% during the forecast period.
