Abstracts

A thermosyphon seal system is a passive, closed-loop heat exchange mechanism designed to cool and maintain the temperature of mechanical seals, particularly those in rotating equipment such as pumps and compressors, by utilizing the natural convection of a fluid—typically a specialized heat transfer medium—that circulates without external mechanical assistance. This system operates on the principle that heated fluid rises to a heat exchanger (often an air-cooled or water-cooled unit) where it dissipates thermal energy, cools, and then descends back to the seal area, creating a continuous cycle that prevents overheating, reduces seal degradation, extends service life, and enhances operational reliability in high-temperature or demanding industrial environments.

The global Thermosyphon Seal System market size was estimated at USD 180.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
