## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Thick Film Paste competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Thick film pastes are specialized materials used in the fabrication of electronic circuits on ceramic or other insulating substrates. These pastes are typically screen-printed onto a substrate and then fired (sintered) at high temperatures to form functional layers such as conductors, resistors, or dielectrics. The thick film paste upstream participants are mainly the manufacturers of raw materials. The core raw materials include functional component (metal, metal oxides, glass, ceramics), organic binder (ethyl cellulose, acetate, etc.), solvent (terpine oil), etc. The downstream applications of thick film pastes are mainly in passive components, sensors, hybrid integrated circuits and power modules, LEDs, and other fields. In 2024, global sales of thick film paste reached approximately 3,295 tons, with an average global market price of around US\$ 427/kg, while global production capacity was 6,700 tons, resulting in a gross profit margin of approximately 15%-20%. The thick-film ecosystem remains structurally resilient because it solves two enduring problems: reliable metallization and passive functionality on ceramics and glass at practical temperatures, and cost-effective patterning at scale. Demand is underpinned by three forces: the ubiquity of ceramic passives and hybrid circuits in consumer and computing hardware; the continued deployment of RF front-ends and co-fired passives in communications hardware; and electrification across mobility and industrial power, which sustains interest in alumina and nitride substrates with robust conductor, resistor and dielectric stacks. Supplier roadmaps show active development in copper and copper-nickel systems for power density and cost control, in low-temperature dielectrics for metal substrates used in lighting and power modules, and in glass-frit sealing for advanced packaging and MEMS. On the risk side, the sector

is exposed to precious-metal volatility, to compliance tightening around hazardous substances, and to competition from alternative interconnect and packaging routes such as plated copper on ceramic or direct-bonded copper laminates. However, the ability of thick-film materials to co-optimize adhesion, solderability, thermal cycling endurance and dielectric integrity on diverse substrates continues to differentiate the technology, particularly where mixed materials, hermeticity, or rapid pattern changes are required.

The global Thick Film Paste market size was estimated at USD 1407.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.90% during the forecast period.
