Abstracts

Thin-film fireproof coatings for steel are coatings applied to the surface of steel structures to provide fire protection. Usually, the coating thickness ranges from 3mm to 7mm. They mainly consist of organic polymer resins, flame retardants, charring agents, foaming agents, etc. When a fire breaks out, these coatings will quickly expand and foam when exposed to heat, forming a dense foam insulation layer. This layer prevents heat from transferring to the steel structure, slowing down the temperature rise of the steel and enabling it to maintain its strength for a certain period. Thus, it prevents the steel structure from deforming and collapsing quickly in the fire, buying time for evacuation and fire rescue. They are characterized by thin coating, good decorative effect and excellent fireproof and heat insulation performance, and are widely used in various steel structure buildings.

The global Thin-film Fireproof Coatings for Steel market size was estimated at USD 1218.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.20% during the forecast period.
