Abstracts

Thin-film intumescent coatings for steel are functional coatings specifically designed for application on the surface of steel structures. Typically, the coating thickness is between 3mm and 7mm. They are mainly composed of binders, intumescent flame retardant systems, pigments, fillers and additives. Under normal conditions, these coatings have good adhesion and certain decorative properties. When exposed to high temperatures in the event of a fire, the coating rapidly expands to form an intumescent carbonaceous foam layer that is several times or even dozens of times thicker than the original coating. This foam layer has excellent heat insulation properties, effectively blocking the transfer of heat to the steel structure. Consequently, it slows down the temperature rise of the steel structure during a fire, improves the fire resistance limit of the steel structure, and buys valuable time for the evacuation of people in the building and fire rescue. They are widely used in the fire protection of various steel structure buildings.

The global Thin Film Intumescent Coatings For Steel market size was estimated at USD 1203.35 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.20% during the forecast period.
