Abstracts

Thin film stress meters are specialized metrology instruments designed to measure the residual stress present in thin film coatings and layers deposited on various substrates, which is a critical quality control parameter in industries such as semiconductor manufacturing, optics, MEMS (Micro-Electro-Mechanical Systems), photovoltaic cells, and advanced materials research. These devices operate on principles such as wafer curvature measurement (using techniques like laser scanning or stylus profilometry), X-ray diffraction, or Raman spectroscopy to quantify stress by analyzing changes in substrate bending, lattice strain, or other physical properties induced by the deposited film. The measurements are essential for predicting film adhesion, durability, and performance, as excessive stress can lead to delamination, cracking, or device failure.

The global Thin Film Stress Meter market size was estimated at USD 110.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
