Report Overview:

A vapor chamber is a planer heat pipe, which can spread heat in two dimensions. They are typically used in high heat flux applications, or when two-dimensional spreading is required. Vapor Chamber technology enables higher CPUs with a higher TDP (or overclocked state) to be efficiently and effectively cooled to safe operating temperatures, extending component and product life. Vapor chamber features a wick design that filled with coolant. When heated, the coolant changes phase from a liquid to a gas and back again to transfer heat. Thin and ultra-thin heat pipe vapor chambers offer excellent choices for space-constrained applications where heat needs to be moved to a remote location or spread quickly to a larger heat sink surface area.

The Global Thin and Ultra-thin Vapor Chambers Market Size was estimated at USD 110.63 million in 2023 and is projected to reach USD 144.90 million by 2029, exhibiting a CAGR of 4.60% during the forecast period.
