Abstracts

Third Generation Sequencing (TGS), also known as long-read sequencing, refers to advanced DNA and RNA sequencing technologies that enable the reading of longer nucleic acid fragments in real-time without the need for PCR amplification, with prominent platforms including those developed by Pacific Biosciences (PacBio) and Oxford Nanopore Technologies (ONT). Unlike earlier short-read methods, TGS provides more comprehensive genomic insights by spanning repetitive regions, resolving complex structural variations, detecting epigenetic modifications directly, and facilitating de novo genome assembly, making it particularly valuable in research areas such as personalized medicine, oncology, infectious disease surveillance, and agricultural genomics. The technology is characterized by its portability (especially nanopore-based devices), decreasing costs, and rapid data generation, though challenges remain in achieving higher accuracy rates compared to established short-read platforms and scaling for ultra-high-throughput applications.

The global Third Generation Sequencing market size was estimated at USD 2528.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 18.65% during the forecast period.
