### Report Overview:

Thoracic catheter is a flexible plastic tube that is inserted through the chest wall and into the pleural space or mediastinum. It is used to remove air (pneumothorax) or fluid (pleural effusion, blood, chyle), or pus (empyema) from the intrathoracic space. It is also known as a B?lau drain or an intercostal catheter.

The thoracic catheter is connected to a closed chest drainage system, which allows for air or fluid to be drained, and prevents air or fluid from entering the pleural space. The system is airtight to prevent the inflow of atmospheric pressure. Because the pleural cavity normally has negative pressure, which allows for lung expansion, any tube connected to it must be sealed so that air or liquid cannot enter the space where the tube is inserted.

The Global Thoracic Catheters Market Size was estimated at USD 411.22 million in 2023 and is projected to reach USD 596.65 million by 2029, exhibiting a CAGR of 6.40% during the forecast period.
