Abstracts

Thoracic fixation systems are a specialized category of medical devices used to stabilize and realign the thoracic spine (the region between the cervical and lumbar vertebrae, typically T1-T12) following trauma, deformity, degenerative conditions, or tumor-related instability. These systems consist of implants such as pedicle screws, rods, hooks, plates, and cross-connectors, which are surgically attached to vertebral structures to provide mechanical support, promote fusion, and restore spinal alignment. The devices are manufactured from biocompatible materials like titanium alloys, cobalt-chromium, or PEEK (polyetheretherketone) and are designed to withstand the biomechanical demands of the thoracic region while minimizing long-term complications.

The global Thoracic Fixation Systems market size was estimated at USD 1295.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.30% during the forecast period.
