Abstracts

A thoracic surgery stapler is a specialized medical device used in cardiothoracic and thoracic surgical procedures to perform precise and efficient tissue transection, resection, and anastomosis, particularly in operations involving the lungs, esophagus, trachea, or major blood vessels within the chest cavity. These staplers are designed to deploy rows of sterile, disposable staples that simultaneously cut and seal tissue, minimizing blood loss, reducing operative time, and lowering the risk of complications such as air leaks or anastomotic leaks compared to traditional suturing techniques. They are available in various configurations, including linear, curved, and circular staplers, often with articulating or rotating heads to enhance accessibility in the confined thoracic space, and may incorporate advanced features such as powered operation, reloadable cartridges, and compatibility with different staple sizes tailored to tissue thickness and type. The device is critical in both open and minimally invasive thoracic surgeries, including video-assisted thoracoscopic surgery (VATS) and robotic-assisted procedures, where precision, reliability, and ease of use are paramount for achieving optimal surgical outcomes.

The global Thoracic Surgery Stapler market size was estimated at USD 1270.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.30% during the forecast period.
