Abstracts

Three band fluorescent lamps, also known as tri-phosphor fluorescent lamps, are a type of gas-discharge light source that uses a blend of three narrow-band phosphors?typically emitting in the red, green, and blue regions of the visible spectrum?to produce a broad, high-quality white light with improved color rendering properties compared to earlier halophosphate-coated fluorescent lamps. These lamps operate by passing an electric current through a low-pressure mercury vapor, which generates ultraviolet radiation that excites the phosphor coating on the inner surface of the glass tube, causing it to fluoresce and emit visible light. Key characteristics include higher luminous efficacy, longer lifespan, and superior color stability, making them suitable for applications where accurate color perception and energy efficiency are priorities, such as in commercial, industrial, and retail lighting environments.

The global Three Band Fluorescent Lamp market size was estimated at USD 4535.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of -3.50% during the forecast period.
