### Report Overview

A three-component geophone is a type of seismic sensor that is used to measure ground motion in three dimensions. It is a type of seismometer that consists of three separate sensors, each of which is oriented along a different axis. Typically, these three sensors are oriented vertically, north-south, and east-west. By measuring ground motion along these three axes, a three-component geophone can provide a more complete picture of the seismic activity in a given area than a single-component geophone, which only measures motion along one axis. Three-component geophones are commonly used in earthquake monitoring, oil and gas exploration, and other geophysical applications.
