Abstracts

Topological insulators are a popular field in condensed matter research. The body of this material is insulated like the insulators commonly known to people, but there are always conductive edge states at its boundaries or surfaces. This is its most unique property that distinguishes it from ordinary insulators. A topological insulator is a material that behaves as an electrical insulator internally and as an electrical conductor on the surface. This means that electrons can only move along the surface of the material. In more technical terms, a topological insulator is an insulator that cannot adiabatically transform into a regular insulator without passing through an intermediate conducting state.
